How it works:

Plugs into USB port to scan staff fingerprints when they clock on and off.	Records and stores staff's unique facial characteristics. It then checks for a match and automatically clocks them on and off.	Staff select their name and register their iris reference. They then scan their iris when clocking in and out for shifts and breaks.	With contactless key fobs, staff can easily scan in and out for shifts and breaks.	Dual sensor cameras scan each employee's face and log staff clock in and out times.	Staff simply enter a pin code or password on a PC or tablet to clock on and off.	With GPS location, staff simply clock on and off with their phone. It pinpoints and compares and records their location against digital clocking records.
